

Sustainability Tracking: Five Stories to Drive Net-Zero

A stakeholder overview for engineering teams, product leadership, and board members, translating net-zero commitments into five actionable system capabilities.

The Challenge

Misaligned Projects

Organizations struggle to align day-to-day project decisions with long-term net-zero targets, leaving strategic commitments disconnected from execution.

Scattered Carbon Data

Emissions impact data lives across disparate workflows, tools, and teams — making it nearly impossible to get a single, reliable view of carbon footprint.

No Cost-Carbon Visibility

Leadership lacks the real-time insight needed to weigh carbon trade-offs against cost and schedule — a critical gap for informed, board-level decision making.

Each story represents a distinct system capability — together, they form a complete sustainability tracking platform from goal-setting to audit-ready reporting.

01	02	03
Define Sustainability Goals	Log Activity Data	Consolidated Dashboard
Project managers set carbon budgets and baselines	Team members capture emissions at the task level	Sustainability officers drill from portfolio to task
04	05	
Cost-Carbon Trade-offs	Audit-Ready Reports	
Executives compare scenarios side-by-side	Compliance officers export locked, versioned evidence	

Story 1: Define Sustainability Goals

Project managers need the ability to establish clear carbon budgets at the outset of every project – defining baselines, setting measurable targets, and scoping emissions boundaries (Scope 1, 2, and 3).

Budget Thresholds

Automated alerts at 50%, 75%, 90%, and 100% of carbon budget consumed

Audit History

Full change history and real-time dashboard visibility for all stakeholders

Story 2: Log Activity Data

Direct Capture

Team members record travel, energy use, and material consumption directly within tasks — no separate tools required.

Smart Emission Factors

The system auto-suggests regionally and temporally appropriate emission factors, reducing manual lookup errors.

Draft & Approval Flow

A structured draft-to-approval workflow with built-in validation ensures data quality before entries are committed.

Story 3: Consolidated Dashboard

Drill-Down Navigation

Sustainability officers can navigate seamlessly from the full portfolio level down to individual project and task emissions — every layer connected and consistent.

Flexible Filtering

Slice data by date range, business unit, emission scope, and activity category to surface the exact insight needed.

Export & Refresh

Reports are exportable in CSV, XLSX, and PDF formats. Data refreshes daily, ensuring leadership always works from current information rather than stale snapshots.

- 📄 Daily refresh cadence keeps all stakeholders aligned on the same version of the truth.

Story 4: Cost-Carbon Trade-offs

Executives need a single view that places carbon impact alongside cost, schedule, and risk — enabling genuinely informed strategic decisions rather than siloed optimisation.

Side-by-Side Comparison

Carbon, cost, schedule, and risk metrics displayed together — no switching between systems to build the picture.

Scenario Modelling

Compare concrete alternatives — travel versus virtual meetings, material A versus material B — with carbon and cost impact calculated instantly.

Board-Ready Exports

One-click exports in business-friendly language — designed for board packs without requiring translation from technical formats.

Story 5: Audit-Ready Reports

Compliance officers require reports that can withstand external scrutiny — not just summary outputs, but full documentation of methodology, evidence, and data lineage.

1

Locked & Versioned

Reports are immutably locked at submission with a complete approval trail — every change recorded.

2

Access & Redaction

Role-based access controls and redaction capabilities ensure sensitive data is protected at every stage.

3

Full Data Lineage

Every emission figure traces back to its source activity, factor, and approver — audit-ready from day one.

Two delivery phases — core tracking first, executive and compliance capabilities second. Together, 34 story points mapping a clear path to a fully operational sustainability platform.

Phase 1 — High Priority Stories 1–3: Define Goals, Log Data, Consolidated Dashboard 21 story points — core tracking and visibility	Phase 2 — Medium Priority Stories 4–5: Cost-Carbon Trade-offs, Audit-Ready Reports 13 story points — executive and compliance features
